

Data Collection and Preprocessing Phase

Date	22 April 2024
Team ID	738194
Project Title	RIPE-SENSE: MANGO QUALITY GRADING WITH IMAGE ANALYSIS AND DEEP LEARNING.
Maximum Marks	6 Marks

Preprocessing Template

The images will be preprocessed by resizing, normalizing, augmenting, denoising, adjusting contrast, detecting edges, converting color space, cropping, batch normalizing, and whitening data. These steps will enhance data quality, promote model generalization, and improve convergence during neural network training, ensuring robust and efficient performance across various computer vision tasks.

Section	Description
Data Overview	Our project leverages a dataset obtained from Kaggle, named 'grading_Data'. This dataset comprises 1100 images featuring mangoes at various stages of ripeness: under-ripen, perfectly ripe, and over-ripen.
Resizing	<i>ImageDataGenerator</i> resizes images to a standard size (e.g., 128x128 pixels) during training for consistency and potentially improved model performance. This helps the model learn features effectively regardless of slight variations in original image sizes.
Normalization	<i>ImageDataGenerator</i> (rescale=1./255) already normalizes the pixel values to the specific range of 0 to 1
Data Augmentation	<i>ImageDataGenerator</i> to artificially create variations of mango images during training. This includes techniques like random rotations and horizontal flipping. This helps the model learn robust features and improve its generalizability to unseen mango images.
